

XLamp® XN-P Color LEDs

XN-P RGBW

XN-P RGB + PC Lime

XN-P RGB + PC Amber

INTRODUCTION

This application note applies to XLamp® XN-P Color LEDs, which have order codes in the following format.

XNPxxx-xx-xxxx-xxxxxxxxxxxx

This application note explains how XLamp XN-P Color LEDs and assemblies containing these LEDs should be handled during manufacturing. Please read the entire document to understand how to properly handle XLamp XN-P Color LEDs.

HANDLING XLAMP® XN-P COLOR LEDS

Manual Handling

Use tweezers to grab XLamp XN-P Color LEDs at the base. Do not touch the lens with the tweezers. Do not touch the lens with fingers. Do not push on the lens.

Minimize shear force on the lens material. Pick parts at the ceramic panel and not from the lens materials. Excessive force on the lens could damage the LED.

Cree LED recommends the following at all times when handling XLamp XN-P Color LEDs or assemblies containing these LEDs:

- Avoid putting excessive mechanical stress on the LED lens.
- Never touch the optical surface with fingers or sharp objects. The LED lens surface could be soiled or damaged, which would affect the optical performance of the LED.
- Cree LED recommends always handling XN-P Color LEDs with appropriate ESD grounding.
- Cree LED recommends handling XN-P Color LEDs wearing clean, lint-free gloves.
- The XLamp XN-P Color LED is vented. Take care to not allow liquids near the vents.

Whenever possible, Cree LED recommends the use of a pick & place tool to remove XLamp XN-P Color LEDs from the factory tape & reel packaging.

ESD

The ESD class rating of XLamp XN-P Color LEDs is Class 3B. Cree LED recommends following the JESD 625 standard, “Requirements for Handling Electrostatic-Discharge-Sensitive (ESDS) Devices,” when handling XN-P Color LEDs or any LED component. Passing a static charge through an electrostatic-discharge-sensitive device can result in performance degradation or catastrophic failure of the device.

Pick & Place Nozzle

For pick and place nozzles coming into contact with glass-lens-encapsulated LED components, Cree LED recommends nozzles be constructed of non-metallic materials. Cree LED and several of Cree LED’s customers have had good success using nozzles fabricated from 95a urethane. The following pick & place tools are specific to the XN-P Color LEDs.

All dimensions in inches [mm.]

Force Limit

When using this recommended nozzle design, do not apply more than 600 gram-force of vertical force to the top of the XLamp XN-P Color LED. Excessive force on the lens could damage the LED. When using alternate nozzle designs, the vertical force limit could be reduced and the limit should be verified by the user to avoid damage to the LED.

CIRCUIT BOARD PREPARATION & LAYOUTS

Printed circuit boards (PCBs) should be prepared and/or cleaned according to the manufacturer’s specifications before placing or soldering XLamp XN-P Color LEDs onto the PCB.

The diagram below shows the recommended PCB solder pad layout for XLamp XN-P Color LEDs.

All dimensions in mm.

Measurement tolerance: .xx = ±13 mm

Recommended PCB Footprint

Recommended Stencil Opening

CASE TEMPERATURE (T_s) MEASUREMENT POINT

XLamp XN-P Color LED case temperature (T_s) should be measured on the PCB surface, as close to the LED’s base as possible. Connect the thermocouple at a point where the voltage potential is below the rating for the meter. Cree LED recommends using a 36 AWG (0.01267 mm²) thermocouple wire for T_s measurements.

It is not required to use a solder footprint for the thermal pad that is larger than the XLamp XN-P Color LED itself. In testing, Cree LED has found such a solder pad to have insignificant impact on the resulting T_s measurement.

NOTES ON SOLDERING XLAMP® XN-P COLOR LEDS

XLamp XN-P Color LEDs are designed to be reflow soldered to a PCB. Reflow soldering may be done by a reflow oven or by placing the PCB on a hotplate and following the reflow soldering profile listed on page 7.

Do not wave solder XLamp XN-P Color LEDs. Do not hand solder XLamp XN-P Color LEDs.

WRONG

Solder Paste Type

Cree LED recommends using one of several solder pastes designed for increased solder joint reliability, for example Alpha® MAXREL™ P30, AIM REL22™ M8 or Indium10.1.

Cree LED recommends the following solder paste compositions: SnAgCu (tin/silver/copper) and SnAg (tin/silver).

Solder Paste Thickness

The choice of solder and the application method will dictate the specific amount of solder. For the most consistent results, an automated dispensing system or a solder stencil printer is recommended. Cree LED has seen positive results with a 3-mil stencil thickness for the stencil layout on page 5.

NOTES ON SOLDERING XLAMP® XN-P COLOR LEDS- CONTINUED

After Soldering

After soldering, allow XLamp XN-P Color LEDs to return to room temperature before subsequent handling. Handling of the device, especially around the lens, before cooling could result in damage to the LED.

Cree LED recommends verifying that soldered LEDs are not tilted, a situation called tombstoning. As a general guideline, an LED is tilted when the part has a low edge touching the PCB surface and a high edge above the PCB surface.

Cree LED recommends verifying the solder process by checking the consistency of the solder bond of several trial PCBs after reflow. This can be done by X-ray or by shearing selected devices from the circuit board. The solder should appear completely re-flowed (no solder grains evident). The solder areas should show minimum evidence of voids on the backside of the package and the PCB.

Cleaning PCBs After Soldering

Cree LED recommends using “no clean” solder paste so that flux cleaning is not necessary after reflow soldering.

MOISTURE SENSITIVITY

Cree LED recommends keeping XLamp LEDs in the provided, resealable moisture-barrier packaging (MBP) until immediately prior to soldering.

Unopened MBPs that contain XLamp LEDs do not need special storage for moisture sensitivity.

Once the MBP is opened, XLamp XN-P Color LEDs may be stored as MSL 1 per JEDEC J-STD-033, meaning they have unlimited floor life in conditions of ≤ 30 °C/85% relative humidity (RH). Regardless of storage condition, Cree LED recommends sealing any unsoldered LEDs in the original MBP.

XLAMP® XN-P COLOR LED REFLOW SOLDERING CHARACTERISTICS

In testing, Cree LED has found XLamp XN-P Color LEDs to be compatible with JEDEC J-STD-020C, using the parameters listed below. As a general guideline, Cree LED recommends that users follow the recommended soldering profile provided by the manufacturer of the solder paste used, and therefore it is the lamp or luminaire manufacturer’s responsibility to determine applicable soldering requirements.

Note that this general guideline may not apply to all PCB designs and configurations of reflow soldering equipment.

IPC/JEDEC J-STD-020C

Profile Feature	Lead-Free Solder
Average Ramp-Up Rate ($T_{s_{max}}$ to T_P)	1.2 °C/second
Preheat: Temperature Min ($T_{s_{min}}$)	120 °C
Preheat: Temperature Max ($T_{s_{max}}$)	170 °C
Preheat: Time ($t_{s_{min}}$ to $t_{s_{max}}$)	65-150 seconds
Time Maintained Above: Temperature (T_L)	217 °C
Time Maintained Above: Time (t_L)	45-90 seconds
Peak/Classification Temperature (T_P)	235 - 245 °C
Time Within 5 °C of Actual Peak Temperature (t_p)	20-40 seconds
Ramp-Down Rate	1 - 6 °C/second
Time 25 °C to Peak Temperature	4 minutes max.

Note: All temperatures refer to topside of the package, measured on the package body surface.

CHEMICALS & CONFORMAL COATINGS

Below are representative lists of chemicals and materials to be used or avoided in LED manufacturing activities. For a complete and current list of recommended chemicals, conformal coatings and harmful chemicals consult Cree LED's [Chemical Compatibility Application Note](#).

Chemicals Tested as Harmful

In general, subject to the specifics in Cree LED's [Chemical Compatibility Application Note](#), Cree LED has found certain chemicals to be harmful to XLamp XN-P Color LEDs. Cree LED recommends not using these chemicals anywhere in an LED system containing XLamp XN-P Color LEDs. The fumes from even small amounts of the chemicals may damage the LEDs.

- Chemicals that might outgas aromatic hydrocarbons (e.g., toluene, benzene, xylene)
- Methyl acetate or ethyl acetate (i.e., nail polish remover)
- Cyanoacrylates (i.e., "Superglue")
- Glycol ethers (including Radio Shack® Precision Electronics Cleaner - dipropylene glycol monomethyl ether)
- Formaldehyde or butadiene (including Ashland® PLIOBOND® adhesive)

Hermetically Sealing Luminaires

For proper LED operation and to avoid potential lumen depreciation and/or color shift, LEDs of all types must operate in an environment that contains oxygen. Simply allowing the LEDs to ventilate to air is sufficient; no extraordinary measures are required. Hermetically sealing LEDs in an enclosed space is not recommended.

ASSEMBLY STORAGE & HANDLING

Do not stack PCBs or assemblies containing XLamp XN-P Color LEDs so that anything rests on the LED lens. Do not handle PCBs or assemblies containing XLamp XN-P Color LEDs so that anything contacts the LED lens. Force applied to the LED lens may result in latent damage to the LED. PCBs or assemblies containing XLamp XN-P Color LEDs should be stacked in a way to allow at least 1 cm clearance above the LED lens.

Do not use bubble wrap directly on top of XLamp XN-P Color LEDs. Force from the bubble wrap can cause latent damage the LED.

Do not use PCBs or assemblies containing XLamp XN-P Color LEDs that have been mishandled (for example, PCBs that have been dropped on the floor) due to the risk of latent damage to the LED.
